

IN THE CLAIMS:

*Please amend claims as follows:*

1. (Currently amended) Method, comprising:

receiving a user input for selecting one individual operational mode from among a plurality of operational modes available for user selection in a first mobile terminal device in accordance with at least one received user input to said first mobile terminal device, said operational modes being related to behavior of the first mobile terminal device in certain operational situations and said one selected operation mode containing a command to perform an automated synchronization with a second mobile terminal device and a command to automatically switch off said first mobile terminal device after completion of said automated synchronization; and

checking availability of a the second mobile terminal device for performing an the automated synchronization between the first mobile terminal device and the second mobile terminal device; and

wherein said one selected individual operational mode contains a command to trigger said automated synchronization with the second mobile terminal device and a command to automatically switch off said first mobile terminal device after completion of said automated synchronization;

if the second mobile terminal device is available, said commands are triggered in said first mobile terminal device for performing said automated synchronization between said first mobile terminal device and said second mobile terminal device in accordance with pre-defined synchronization settings and automatically switching off said first mobile terminal device after completion of said automated synchronization, or

if the second mobile terminal device is unavailable or becomes unavailable for synchronization, aborting said automated synchronization and said automatically switching off the first mobile terminal device are aborted, whereby said first mobile terminal device is not switched off,

wherein the automatically switching off of the first mobile terminal device is such that all service functions of the first mobile terminal device are terminated.

2-3. (Canceled)

4. (Currently amended) Method according to claim 1, wherein said one selected ~~individual~~ operational mode comprises an activation that triggers an immediate automated synchronization.

5. (Currently amended) Method according to claim 1, wherein said one selected ~~individual~~ operational mode once deactivated triggers an immediate automated synchronization.

6. (Previously presented) Method according to claim 4, wherein said activation comprises switching on said first terminal device.

7. (Currently amended) Method according to claim 1, wherein said ~~at least one~~ user input triggers a ~~switching~~ switching-on of said first mobile terminal device.

8. (Currently amended) Method according to claim 1, wherein said ~~at least one~~ user input triggers a ~~switching~~ switching-off of said first mobile terminal device.

9. (Previously presented) Method according to claim 1, wherein said pre-defined synchronization settings comprise information relating to properties including at least one of a group comprising: information relating to specific data to be synchronized; information relating to specific applications of which data is to be synchronized; information about a type of synchronization; information relating to said second mobile terminal device; authentication

information; information relating to a communication connection to be used for synchronization; and information about an environment in which said automated synchronization is to be carried out.

10. (Original) Method according to claim 1, wherein said automated synchronization is performed via a local communication connection.

11. (Previously presented) Method according to claim 1, wherein said automated synchronization is performed in a device-to-device manner.

12. (Previously presented) Method according to claim 1, wherein said automated synchronization is based on a synchronization markup language standard.

13. (Previously presented) Method according to claim 1, wherein said first mobile terminal device is a cellular communication device.

14. (Previously presented) Software tool for automated synchronization between a first mobile terminal device and a second mobile terminal device, comprising a computer program for carrying out the method of claim 1 when said program is executed on a processing device.

15. (Previously presented) Computer program product for automated synchronization between a first terminal mobile device and a second mobile terminal device, comprising program code stored on a computer readable medium for carrying out the method of claim 1, when said computer program is executed on a processing device.

16. (Previously presented) Computer program product for automated synchronization between a first terminal mobile device and a second mobile terminal device, wherein said computer program product comprises program code stored on a computer readable medium

for carrying out the method of claim 1, when said computer program product is executed on a processing device.

17. (Currently amended) ~~Mobile terminal device having a plurality of operational modes related to behavior of the mobile terminal device in certain operational situations~~ Apparatus, comprising:

~~at least one actuator~~ a user interface for receiving a user input for selecting selection of one operational mode out of from a said plurality of operational modes, said operational modes being related to behavior of the apparatus in certain operational situations; “

~~a synchronization component for determining if another mobile terminal device~~ apparatus is connectable and ready for synchronizing information stored in a data storage; and

~~a communication interface for exchanging synchronization related information with the other apparatus;~~

~~wherein the one selected operational mode includes~~ contains ~~a command to trigger perform an automated synchronization with said other mobile terminal device~~ apparatus, and a command to automatically switch off said ~~mobile terminal device~~ apparatus after completion of said automated synchronization, and

wherein

~~if said other mobile terminal device~~ apparatus is determined to be connectable and ready for synchronization, in response to said commands, said synchronization component is activated to perform said automated synchronization with said other ~~mobile terminal device~~ apparatus via said communication interface, ~~said automated synchronization is performed~~ in accordance with pre-defined synchronization settings, and said ~~mobile terminal device~~ apparatus is automatically switched off after completion of said automated synchronization, or

~~if said other mobile terminal device~~ apparatus is or becomes not connectable or not ready for synchronization, said automated synchronization and said switching off the ~~mobile~~

~~terminal device~~apparatus are aborted, whereby said ~~mobile terminal device~~apparatus is not switched off, and

wherein the automatically switching off of the apparatus is such that all service functions of the apparatus are terminated.

18. (Canceled)

19. (Currently amended) ~~Mobile terminal device~~Apparatus according to claim 17, wherein said ~~at least one actuator~~user interface comprises a power on/off actuator for triggering a switching on and a switching off of said ~~mobile terminal device~~apparatus.

20. (Currently amended) ~~Mobile terminal device~~Apparatus according to claim 17, wherein said communication interface is for exchanging said synchronization related information via a local communication connection in a device-to-device manner.

21. (Canceled)

22. (Currently amended) System, comprising

a first mobile terminal device operable in a plurality of operational modes related to behavior of the first mobile terminal device in certain operational situations; and

a second mobile device,

wherein said first mobile terminal device comprises:

~~at least one actuator~~a user interface for receiving a user input for selecting selection of one operational mode out of from the plurality of operational modes;

a synchronization component for determining if the second mobile terminal device is connectable and ready to synchronize information stored in a data storage; and

a communication interface for exchanging synchronization related information;

said second mobile terminal device comprises:

a synchronization component for synchronizing of information stored in a data storage with said first terminal device; and

a communication interface for exchanging synchronization related information;  
wherein

said one selected operational mode of said first terminal device contains a command to ~~trigger-perform~~ an automated synchronization with the second mobile terminal device ~~if said second mobile terminal device is determined connectable and ready to synchronize,~~ and a command to automatically switch off said first terminal device after completion of said automated synchronization;

wherein

said synchronization component of said first terminal device is activated in response to said commands if said second terminal device is determined to be connectable and ready to perform said automated synchronization with said synchronization component of the second mobile terminal device via said communication interface of said first mobile terminal device and said communication interface of said second mobile terminal device, said automated synchronization is performed in accordance with pre-defined synchronization settings, and said first mobile terminal device is switched off after completion of said automated synchronization, or

said automated synchronization and said switching off the first mobile terminal device are aborted, whereby said first mobile terminal device is not switched off, if said second mobile terminal device is or becomes not connectable or not ready for synchronization, and

wherein the automatically switching off of the first mobile terminal device is such that all service functions of the first mobile terminal device are terminated.

23. (Canceled)

24. (Currently amended) System according to claim 22, wherein said ~~at least one actuator~~user interface comprises a power on/off actuator for switching on and switching off said first mobile terminal device.

25. (Previously presented) System according to claim 22, wherein said communication interface of said first mobile terminal device is for exchanging said synchronization information via a local communication connection in a device-to-device manner with said communication interface of said second mobile terminal device.

26. (Canceled)

27. (Previously presented) System according to claims 22, wherein said actuator of said first mobile terminal device is responsive to receipt of a user input, wherein said synchronization component of said first mobile terminal device is responsive to said user input for performing said automated synchronization between said first mobile terminal device and said second mobile terminal device in accordance with said pre-defined synchronization settings.

28. (Currently amended) Apparatus, comprising:

means for receiving a user input to select ~~selecting in a first mobile terminal device one individual operational mode from a plurality of operational modes, said operation modes being related to behavior of the apparatus in certain operational situations and in accordance with at least one received user input to said first mobile terminal device wherein said one selected individual operational mode contains~~ containing a command to ~~trigger performing an automated synchronization with a second mobile terminal device~~ another apparatus and a command to automatically switch off the ~~first mobile terminal apparatus~~ after completion of said automated synchronization;

means for checking availability of said second ~~mobile terminal device~~ apparatus for performing said automated synchronization ~~so that said automated synchronization is~~

~~triggered by said availability;~~

~~means for performing said automated synchronization between said first mobile terminal device and said second mobile terminal device in accordance with pre-defined synchronization settings if said second mobile terminal device is available; and~~

~~means for switching off the first mobile terminal~~apparatus ~~after completion of said automatic synchronization,~~

~~wherein~~

~~if the other apparatus is available, said automated synchronization is performed and said apparatus is automatically switched off after completion of said automated synchronization, or~~

~~if said other mobile terminal device~~apparatus ~~is or becomes not connectable or not ready for synchronization, said automated synchronization and said switching off the mobile terminal device~~apparatus ~~are aborted, whereby said apparatus~~mobile terminal device ~~is not switched off, and~~

~~wherein the automatically switching off of the apparatus is such that all service functions of the apparatus are terminated.~~
